

Dräger X-plore® filters

Cross section Dräger X-plore® filters

PARTICLE FILTERS

GAS FILTERS

COMBINATION FILTERS

Filter selection

Contaminants come in different forms – generally: aerosols (dusts, mists, fibres, fumes, microorganisms) or gases or vapours. You can choose between the filter types to protect against one of these forms or a combination of both of them. The following table shows you the colour coding of filters according to EN 14387 – which helps you to determine which filter-type is needed for the contaminants you are dealing with.

FILTER COLOUR IDENTIFICATION

| Colour code | Filter type | Contaminants present                                                            |
|-------------|-------------|---------------------------------------------------------------------------------|
|             | AX          | Gases and vapours of organic compounds with boiling point < 65°C                |
|             | A           | Gases und vapours of organic compounds with boiling point > 65°C                |
|             | B           | Inorganic gases and vapours, e.g. chlorine, hydrogen sulphide, hydrogen cyanide |
|             | E           | Sulphur dioxide, hydrogen chloride                                              |
|             | K           | Ammonia and organic ammonia derivates                                           |
|             | CO          | Carbon monoxide                                                                 |
|             | Hg          | Mercury vapour                                                                  |
|             | NO          | Nitrous gases including nitrogen monoxide                                       |
|             | Reactor     | Radioactive iodine including radioactive methyl iodide                          |
|             | P           | Particles                                                                       |

Differentiation of filter types

Filters are split in different classes according to their capacity (gas filters) or their efficiency (particle filters). The class of a particle filter indicates how efficient the filter is in filtering out particles: **class 1:** 80%, **class 2:** 94%, **class 3:** 99.95%

FILTER TYPE

| Filter type     | Filter class | Protection against                               | Maximum permissible concentration of toxic substance                                     |
|-----------------|--------------|--------------------------------------------------|------------------------------------------------------------------------------------------|
| Gas filter      |              | Gases and vapours                                | 50 times the OEL with half masks / 2000 times the OEL with full face masks, but maximal: |
|                 | 1            | Small                                            | 0.1 vol. % (1000 ppm)                                                                    |
|                 | 2            | Medium                                           | 0.5 vol. % (5000 ppm)                                                                    |
| Particle filter | 3            | Large                                            | 1.0 vol. % (10000 ppm)                                                                   |
|                 |              | Particle Efficiency (separation ability):        |                                                                                          |
|                 | 1            | Small                                            | 4 times the OEL with half masks / 5 times the OEL with full face masks                   |
| Combined filter | 2            | Medium                                           | 12 times the OEL with half masks / 16 times the OEL with full face masks                 |
|                 | 3            | Large                                            | 48 times the OEL with half masks / 1000 times the OEL with full face masks               |
|                 |              | Gases, Vapours, Particles                        |                                                                                          |
|                 | 1-P2         | Appropriate combined gas and particulate filters | Appropriate combined levels                                                              |
|                 | 2-P2         |                                                  |                                                                                          |
|                 | 1-P3         |                                                  |                                                                                          |
|                 | 2-P3         |                                                  |                                                                                          |

Values are the Nominal Protection Factors, taken from the CEN Report 529. Additional national and local regulations must be followed.

According to EN143:2006/A1 particle filters have to be marked regarding reusability:  
**NR** (Non Reusable) if the filter is limited to single shift only  
**R** (Reusable) if the filter is re-usable

**Warning:** Never use any kind of filtering respiratory protection device:  
– in oxygen deficient atmosphere (see local legislation for further guidelines e.g. UK less than 19 vol. % O<sub>2</sub>)  
– in poorly ventilated areas or confined spaces, such as tanks, small rooms, tunnels, or vessels  
– in atmospheres where the concentrations of the toxic contaminants are unknown or are immediately dangerous to life or health (IDLH)  
– when the concentration of a contaminant is higher than the maximum permissible concentration and/or the filter class capacity
